Project Name	Smart Fashion Recommender Application

Checking For any errors in our application :

We implemented flask in python to create a backend server for the application. If any error happens at the server side then it is a failure.

So we are checking if there is any server issues.

Next we should check IBM cloud issues. Because all our files such as images, stylesheets, etc., are stored on the IBM cloud.

It's data should always be available for public so that no more issues could be created.

Also we should check IBM DB2 for any errors. It is possible that database could be unavailable and make our application failure.
